                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                   5286

Lins is the amino acid sequence of Arabidopsis thaliana (SDH), as deduced from a sequence (LKR)/Saccharopine dehydrogenase (SDH), as deduced from a gene (see AAV99599) isolated from a CD4-8 Land8berg erecta genomic library. The protein lacks an N-terminal cargetting sequence suggesting that the lysine degradative cargetting sequences suggesting that the lysine degradative comprised nucleic acid fragments comprising sequences encoding all compart of plant LKR polypeptides are new. Also claimed are: (1) a clinked no sultable seed specific regulator, where the chimeric gene comprising the fragment (or a subfragment) operably gene reduces LKR activity in plant seeds transformed with it; (2) mutation in the gene encoding LKR activity is reduced due to a chimeric gene; (3) a nucleic acid fragment comprising; (1) chimeric acid fragment encoding LKR activity is reduced due to a chimeric gene; (3) a nucleic acid fragment comprising; (1) chimeric acid fragment encoding LKR activity is reduced due to a chimeric gene; (3) a nucleic acid fragment comprising; (1) chimeric acid fragment encoding LKR activity; soperably linked acid fragment encoding dihydrodipicolinic acid synthase (DHDPS) cubstantially insensitive to lysine inhibition is operably linked seed specific regulatory sequence and to a plant cased seed with reduced LKR activity, especially in Arabidopsis, and seeds with reduction may be used to produce plant cells corn, soybean, rapeseed, wheat and rice (claimed). LKR is important in controlling free lysine accumulation in plant seeds. Infragment, preparing a chimeric gene for cosuppression of LKR, activity encounting plants with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ILSDRAYAFFSHTHKAQKENMPLLDKILEERVSLFDYELIVGDDGKRSLAFGKFAGRAGL 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 IDFLHGLGORYLSLGYSTPFLSLGOSHMYPSLAAAKAAVIVVAEBIATFGLPSGICPIVF 180

This is the amino acid sequence of a maize lysine ketoglutarate reductase (LKR) or saccharopine dehydrogenase (SDH) partial polyeptide. It was deduced from cDNA (see AAV99564) obtained from developing seed mRNA by PCR and RACE. Isolated nucleic acids comprising sequences encoding all or part of plant LKR enzymes are new. Also claimed are: (1) a chimeric gene comprising the fragment (or a subfragment) operably linked to a seed specific regulator, where the chimeric gene reduces LKR activity in plant

seeds transformed with it; (2) plant cells and seeds in which LKR activity is reduced due to a mutation in the gene encoding LKR or transformation with the chimeric gene; (3) a nucleat caid fragment comprising; (i) chimeric gene above, and (ii) a second chimeric gene; (a) which a nucleic acid fragment encoding dihydrodipicolinic acid synthase (DHDPS) substantially insensitive to lysine inhibition is operably linked to a plant chloroplast transit sequence and to a operably linked to a plant chloroplast transit sequence and to a coperably linked to a plant chloroplast transit sequence and to a coperably linked to appear comprising in genome (i) and (ii), especially as fragment of (2); and (5) seeds from (3). The chimeric genes can be used to produce plant cells can seeds with reduced LKR activity, especially in Arabidopsis, corn, soybean, rapesed, wheat and rice (claimed). LKR is corn, soybean, rapesed, wheat and rice (claimed). LKR is important in controlling free lysine accumulation in plant seeds. IKR activity reduction may be achieved by cloning the claimed fragment, preparing a chimeric gene for cosuppression of LKR, the chimeric gene for LKR, and transforming plants with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DMSYSELEVGADDTATLDKIIDSLTSLANEHGGDHDAGQEIELALKIGKVNEYETDVTID 540

This is the amino acid sequence of a soybean near full-length

(C) Iysine ketcglutarate reductase (LKR) or saccharopine dehydrogenase

(E) (S) It was deduced from CDNA (see AAV99562) obtained from

(E) developing seed mRNA by PCR and RACE. Isolated nucleic acids

(C) comprising sequences encoding all or part of plant LKR enzymes are

(C) fragment (or a subfragment) operably linked to a seed specific

(E) regulator, where the chimeric gene reduces LKR activity in plant

(C) seeds transformed with it; (2) plant cells and seeds in which LKR

(C) cactivity is reduced due to a mutation in the gene encoding LKR or activity is reduced due to a mutation in the gene encoding LKR or activity is reduced due to a mutation in the gene encoding LKR or transformation with the chimeric gene above, and (ii) a second chimeric gene,

(C) comprising: (i) chimeric gene above, and (ii) a second chimeric gene,

(C) synthase (DHDPS) substantially insensitive to lysine inhibition is

(E) operably linked to a plant chloroplast transit sequence and to a

(E) plant seed-specific regulatory sequence; (4) plants comprising in

(E) plant seed-specific regulatory sequence; (4) plants comprising in

(E) plant seed-specific regulatory sequence; (4) plants comprising in

(E) plant seeds with reduced LKR activity, especially in Arabidopsis,

(C) corn, soybean, rapeseed, wheat and rice (claimed). LKR is

(E) important in controlling free lysine accumulation in plant seeds.

(C) fragment, preparing a chimeric gene.

(C) expression of antisense RNA for LKR, and transforming plants with
Claim 2; Page 186-188; 231pp; English.

Nucleic acid fragments comprising sequences encoding all or part of plant LKR polypeptides are new. Also claimed are: (1) a chimaric gene comprising the fragment (or a subfragment) operably linked to a suitable seed specific regulator, where the chimaric gene reduces LKR activity in plant seeds transformed with it: (2) plant cells and seeds in which LKR activity is reduced due to a mutation in the gene encoding LKR or transformation with the chimaric gene; (3) a nucleic acid fragment comprising; (1) chimeric gene above, and (ii) a second chimaric gene, in which a nucleic acid fragment encoding dihydrodipicolinic acid synthase (PHDPS) substantially insensitive to lysine inhibition is operably linked to a plant chloroplast transit sequence and to a spant seed specific regulatory sequence; (4) plants comprising in genome (i) and (ii), especially as fragment of (2); and (5) seeds from (3). The chimeric genes can be used to produce plant cells

                                                                                                                                                                                                                                                                                                                                                 and seeds with reduced LKR activity, especially in Arabidopsis, corn, soybean, rapeseed, wheat and rice (claimed). LKR is important in controlling free lysine accumulation in plant seeds. LKR activity reduction may be achieved by cloning the claimed fragment, preparing a chimeric gene for cosuppression of LKR, expression of antisense RNA for LKR, and transforming plants with

The invention relates to invertebrate enzymes and nucleic acids, including lysine-ketoglutarate reductase/saccharopine dehydrogenese (LKR/SDH) and peptidyl-alpha-hydroxyglycine alpha-amidating lyase (PAL) from Drosophila metanogaster, designated dmLKR/SDH, dmPAL and dmPAL2. from Drosophila metanogaster, designated dmLKR/SDH, dmPAL and dmPAL2. The enzymes are useful for detecting a candidate compound especially a putative pesticidal or pharmaceutical agent that interacts with an invertebrate enzyme or its fragment. The identified compound is useful controlling a pest, by reducing viability of the pest. Insect or worm genetically modified to express the enzyme are useful for studying invertebrate enzyme activity and for identification and screening of pesticide targets directed to components of a pathway involving a subject protein. Nucleic acids encoding the invertebrate enzymes or their fragments are useful as biopesticides. The enzymes and thair DNA are useful for genetically modifying metazoan invertebrate enzymes or their fragments are useful as biopesticides. The enzymes and thair DNA are as insects and worms or cultured cells, resulting in expression or mis-expression of the protein. The organisms or cultured cells are useful in identification of new drug targets, therapeutic agents, diagnostics and prognesics useful in treatment of disorders associated with abnormal enzyme levels and/or Intreatment of Sprosophila melanogaster LKR/SDH (missing principal enzyme in the catabolism of
                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel invertebrate enzymes and nucleic acid encoding the enzyme useful as targets for pesticides and to identify compounds that have utility as therapeutics or pesticides -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     QKENMPLLDKILEERVSLFDYELIVGDDGKRSLAFGKFAGRAGLIDFLHGLGQRYLSLGY 136

```
This is the amino acid sequence of a rice lysine ketoglutarate reductase (LKR) or saccharopine dehydrogenase (SDH) partial polyeptide. It was deduced from CDNA (see AAVV99565) obtained from an EST database search. Isolated nucleic acid fragments comprising sequences encoding all or part of plant LKR enzymes are new Also claimed are: (1) a chimeric gene comprising the fragment (or a subfragment) operably linked to a seed specific regulator, where the chimeric gene reduces LKR activity in plant seeds transformed with it; (2) plant cells and seeds in which LKR activity is reduced due to a mutation in the gene encoding LKR contribing: (i) chimeric gene, (i) a nucleic acid fragment comprising: (i) chimeric gene above, and (ii) a second chimeric gene, in which a nucleic acid fragment encoding dihydroxolpicolnic acid fragment encoding dihydroxolpicolnic acid soperably linked to a plant chloroplast transit sequence and to a plant seed specific regulatory sequence; (4) plants comprising in genome (i) and (ii), especially as fragment of (2); and (5) seeds from (3). The chimeric genes can be used to produce plant cells and seeds with reduced LKR activity, especially and reduced LKR activ
                                                                                                                                                                                              ucleic acids and chimeric genes for increasing seed lysine content comprise sequence encoding all or part of lysine ketoglutarate eductase, useful to improve nutritional quality of seeds from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   fragment, preparing a chimeric gene for cosuppression of LKR, expression of antisense RNA for LKR, and transforming plants with

Wheat lysine ketoglutarate reductase partial sequence.

(first entry)

ó

```
This is the amino acid sequence of a wheat lysine ketoglutarate reductase (LKR) or saccharopine dehydrogenase (SDH) partial polyeptide. It was deduced from cDNA (see AAV99567) obtained from comprising sequences encoding all or part of plant LKR enzymes are new. Also claimed are: (1) a chimeric gene comprising the fragment) operably linked to a seed specific requilator, where the chimeric gene reduces LKR activity in plant seeds transformed with it; (2) plant cells and seeds in which LKR activity is reduced due to a mutation in the gene encoding LKR or transformation with the chimeric gene; (3) a nucleic acid fragment comprising; (i) chimeric gene above, and (ii) a second chimeric gene, in which a nucleic acid fragment encoding dihydrodipicollinic acid synthase (DHDPS) substantially insensitive to lysine inhibition is operably linked to a plant chloroplast transit sequence and to a plant seed-specific regulatory sequence; (4) plants comprising in genome (i) and (ii), especially as fragment of (2); and (5) seeds from (3). The chimeric genes can be used to produce plant cells and seeds with reduced LKR activity, especially in Arabidopsis, corn, soybean, rapeseed, wheat and rice (claimed). LKR is important in controlling free lysine accumulation in plant seeds. LKR activity reduced LKR activity and plant of LKR activity reduced LKR activity and claimed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               940 YPDGQPAEKHQATLLEFGKVENGRSTTAMALTVGIPAAIGALLLLKNKVQTKGVIRPLQP 999

Lysine ketoglutarate reductase; saccharopine dehydrogenase;

transgenic plant; seed.

Arabidopsis thaliana.

W09842831-A2 01-OCT-1998.

Arabidopsis lysine ketoglutarate reductase.

29-MAR-1999 (first entry)

```
The present sequence represents a protein homologous to fungal saccharopine dehydrogenases. The specification describes a Corynebacterium dapA gene, which encodes a dihydrodipicolinic acid synthase (PHDPS) enzyme, which was used to create chimeric genes of the invention. The chimeric genes contain a nucleic acid fragment encoding a DHDPS enzyme which is insensitive to inhibition by lysine operably linked to a plant chloroplast transit sequence and to a plant seed-specific regulatory sequence. The chimeric genes are useful for producing plants containing increased levels of lysine, especially in corn (Zea mays) and soybean (Glycine max).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Chimeric genes encoding lysine production enzymes – useful for increasing transgenic seed lysine content without being inhibited by high levels of the amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

Jyshe ketoglutarate regulered in introducipts untilized on the basis of homology to a fungal glutamate-forming saccharopine dehydrogenase. Isolated nucleic acid fragments comprising comprising sequences encoding all or part of plant LKR polypeptides are new. Sequences encoding all or part of plant LKR polypeptides are new. As claimed are: (1) a chimeric gene comprising the fragment (or a subfragment) operably linked to a suitable seed specific regulator, where the chimeric gene reduces LKR activity in plant seeds transformed with ti; (2) plant cells and seeds in which LKR or transformation with the chimeric gene; (3) a nucleic acid fragment comprising; (1) chimeric gene above, and (i1) a second chimeric gene, in which a nucleic acid fragment encoding dihydrodipticollinic acid synthase (DHDPS) substantially insensitive to lysine inhibition is operably linked to a plant chloroplast transit sequence and to a plant chloroplast transit sequence and to a plant capacity sequence; (4) plants comprising in and (ii), especially as fragment of (2); and (5) seeds from (3). The chimeric genes can be used to produce plant cells and seeds with reduced LKR activity, sepecially in Arabidopsis, and seeds with reduced LKR activity, sepecially in Arabidopsis, in protrant in controlling free lysine accumulation in plant seeds. LKR activity reduction may be achieved by cloning the claimed capacing a chimeric gene for cosuppression of LKR. the chimeric gene for cosuppression of LKR. the chimeric gene for the cosuppression of LKR. The chimeric genes can be the cosuppression of LKR. The chimeric genes active by cloning the claimed capacity the chimeric genes can be controlling to a plant seeds. The chimeric genes can be used to produce plant seeds. The chimeric genes can be used to produce plant seeds. The chimeric genes can be used to produce plant seeds. The chimeric genes can be used to produce plant seeds. The chimeric genes can be used to produce plant seeds. The chimeric genes can be used to produce plant seeds. The chimeric gene

The specification describes a Corymebacterium dapA gene, which encodes a dihydrodipicolinic acid synthase (DHDPS) enzyme, which was used to create chimeric genes of the invention. The chimeric genes contain a nucleic acid fragment encoding a DHDPS enzyme which is insensitive to inhibition by lysine operably linked to a plant chloroplast transit sequence and to a plant seed-specific regulatory sequence. The chimeric genes are useful for producing plants containing increased levels of lysine, especially in corn (Zea mays) and soybean (Glycine max).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           526 KIGKVNEYETDVTIDKGGPK-----ILILGAGRVCRPAAEFLASYPDICT-----YG 572

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Microtubule-associated protein 2b - rat

N.Alternate names: MAP2b

N.Cohtains: microtubule-associated protein 2c (MAP2c)

C.Species.: Rattus norvegicus (Norway rat)

C.Species.: Nature 1999

E.Kindler, S., Schulz, B.7981; S1003; S07887; S14568

E.Kindler, S., Schulz, B.; Goedert, M.; Garner, C.C.

A. Species.

A. Fitle: Molecular structure of microtubule-associated protein 2b and 2c from rat br
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A; Molecule type: mRNA

gen

Nucleotide sequence of a Bacillus megaterium gene homologous to the dnaK ce number: 139837; MUID:87231083

A,Title: Nucleotide sequence of a Bacillus megaterium gene homologous to the A,Reference number: 139837; MUD:87231083
A,Accession: 139837
A,Accession: 139837
A,Accession: 139837
A,Accession: 139837
A,Accession: 139837
A,Accession: 139837
A,Reference repe: DNA
A,Reference repe: DNA
A,Reference repe: DNA
A,Cross-references: GB:M31338; NID:g39628; PIDN:CAA68348.1; PID:g39629
C,Function: involved in protein folding and assembling/disassembling of 1
C,Superfamily: heat shock protein 70
C,Superfamily: heat shock protein 70
